

Consolidating robot equipment software in robot controllers

Single-PC Integrated Control

Realize simple equipment architecture using Single-PC Integrated Control

We've incorporated the RC9 firmware, 3D machine vision image recognition software, a UI, and WINCAPS Plus optimal path planning into TwinCAT's IPC, making it possible to recognize bulk workpieces and automatically generate optimal paths that avoid obstructions with a single computer.

Group and control old and new DENSO robots Demonstration that takes maximum advantage of RC9 features

- Selectivity: Select the optimal IPC for your application.
- Open architecture: Robot control coexists with commercially available and custom application software.
- Expandability: Control existing DENSO robots with an RC9 firmware-controlled IPC.
